

The SPACEA[™] Series—responding to extreme, special environments

NSK's SPACEA[™] Series adapts the vacuum lubrication, material, and thin-film technologies for advanced applications. Our wide array of bearings, ball screws, and NSK Linear Guide[™] products offer high functionality and unmatched quality in special environments. As such, the SPACEA Series stands up to tough operation requirements in vacuum, corrosive, cleanroom, high-temperature, non-magnetic, and contaminated environments.

NSK Global Network

NSK's global network is key to our ability to develop innovative products that incorporate the latest technologies.

Our network connects each sales branch, distribution center, production facility, and technology center and enables us to gather the latest information from each location.

Data is instantly accessible to every part of the network, resulting in products of the highest quality.

Our global system also receives and processes orders, ships products, and provides technical support.

By leveraging our resources, NSK quickly responds to diverse challenges, no matter how complex.

NSK's global network means excellent products and superior customer service.

NSK's communication system links the major markets of the world in Europe, Asia, Japan, and the Americas. We use this highly developed system to share information on changes and trends in each market in real time. As a result, we can react quickly to meet changing customer needs, supplying optimized, high-quality products. Our global network makes NSK a truly global company. We are able to transcend borders and other restrictions to meet the needs of our customers around the globe.

NSK 5

NSK Research and Development

Extensive commitment to research and development through a network of four bases in the United States, Europe, and Asia, with Japan as the core.

NSK's R&D centers concentrate on enhancements in our core technologies of tribology, materials numerical simulation and mechatronics. These form the basis for development of NSK's current and future product lineups. We strive to improve our fundamental technologies while preparing for future changes.

Bearing internal clearance and standard values

Internal clearance of bearings refers to the amount that one ring, either the inner or outer, can be displaced relative to the other ring when one is fixed and the other is displaced either vertically or horizontally. The amount of displacement in the radial plane is called radial clearance, while the amount of displacement in the axial plane is called axial clearance.

Clearance is measured by adding a specific measuring load to a bearing in order to obtain a stable measured value. As a result, the measured clearance value, or measured internal clearance, becomes slightly larger than the theoretical internal clearance value (also known as geometrical clearance in the case of a radial bearing). The difference is known as the elastic deformation.

Theoretical internal clearance is derived by compensating for clearance caused by elastic deformation.

Internal clearance of bearings prior to installation is usually defined by the theoretical internal clearance value.

40	50	1	11	6	23	18	36	30	51	45	73			

Remarks When using the above values as measured clearance, the radial clearance caused by the measuring load must be compensated by the clearance compensation values listed in the following table. For compensation values for C2 clearance, the smaller value is applied to the smallest clearance and the larger value is applied to the largest clearance.

(3) The limiting speed of these bearings has been calculated for 25 °C operating conditions. Limiting speeds will be slower for operating conditions of 35 °C or highter. (Refer to Page A33 for further details.)

(4) Applied load values are for reference only; they are not guaranteed.

(5) Orders for standard inventory may be delayed, particularly if shipped from Japan.

Remarks 1. The radial internal clearance for the bearings on this page is CN. See the radial internal clearance tables on Page A10 for further details.

2. Rubber contact seals are standard.

1. Stainless Steel Bearings Pages A11-A14 Dimensions, accuracy and availability of bearings.

Stainless steel bearings, the standard products of the NSK SPACEA[™] Series for special environments, are suitable for high-humidity environments.

A A A					
Structure		Open, Shielded, Sealed			
	Outer/Inner rings	Martensite stainless stee	el		
	Balls	Martensite stainless steel			
Specifications	Cage	Polyamide resin or stainless steel			
	Lubricant	Lithium-based grease	(Open bearings do not come with packed grease.)		
	Shields/Seals	Austenite stainless steel	/Nitrile rubber		

Applications: Equipment used in high-humidity environments: food processing, cleaning, chemical processing, fishery equipment

Features

- For use at normal atmospheric pressure, with grease lubrication
- Higher corrosion resistance than bearing steel
- Open, shielded, and contact sealed bearings are available (see A11-A14)

NSK Highly Corrosion-Resistant ES1 Stainless Steel

Check with NSK for applicable designations.

Performance

Material	Hardness, HRC	Corrosion resistance ⁽¹⁾	Features
NSK highly corrosion-resistant ES1 stainless steel	58–62	0	NSK-developed steel
Martensite stainless steel SUS440C	58–62	Δ	Ordinary stainless steel
Bearing steel SUJ2	60–64	×	Ordinary steel for bearings

Corrosion resistance of ES1

Outperforms SUS440C in corrosion resistance

Immersion rolling fatigue life Outperforms SUS440C in durability

Test bearing: 51305 Balls: Ceramic Speed: 1 000 min-Load: 980 N

Operating Instructions and Notes

- For use in normal atmospheric conditions only.
- Bearings stocked as standard inventory items are prepacked with NS7 (lithium-based) grease.
- Keep bearings packed until immediately before mounting.
- See the tables on Pages A11 through A14 for limiting loads and limiting rotational speeds.
- Bearings may not be usable in certain corrosive environments or conditions.
- All comments referencing certain values or performance in this catalog are for reference only. NSK provides this guide "as is" without express or implied warranties of any kind.

Note (1) Comparative assessment between three kinds of materials

2. Stainless Steel Angular Contact Ball Bearings

For use in atmospheric pressure and cleanroom environments For use in vacuum, cleanroom, and high-temperature environments

Page A15

Features

- Outperforms standard bearing steel in terms of corrosion resistance.
- Achieves high running accuracy to ISO tolerance class P5.
- Supports universal matching with light preload when mounted in a face-to-face (DF) arrangement or back-to-back (DB) arrangement.
- Stainless steel angular contact ball bearings come in two variations: one set is suitable for cleanroom and normal atmospheric pressure conditions while the other is suited for cleanroom, vacuum, and high-temperature environments.

Operating Instructions and Notes

- Keep bearings packed until immediately before mounting.
- For cleanroom and normal environment bearings, first clean the bearings to remove the anti-corrosion agent before applying a suitable grease.
- Vacuum, cleanroom, and high-temperature environment bearings have already been degreased and cleaned. Please apply a suitable grease.

Featuring highly corrosion-resistant ES1 stainless steel

Applications: Flat panel display cleaning equipment, film cleaning systems, etching equipment, conveyance equipment

Features

- Highly resistant to corrosion thanks to ES1: a highly corrosion-resistant stainless steel.
- Self-aligning with the ability to accommodate misalignment of the axis and housing from 4 to 7 degrees.

Operating Instructions and Notes

- Keep bearings packed until immediately before mounting.
- Clean the bearings to remove the anti-corrosion agent before applying a suitable grease.
- See the tables on Page A15 for limiting loads and limiting rotational speeds.

4. Molded-Oil[™] Bearings

Molded-Oil[™] bearings, made of stainless steel, are lubricated with an original oil-containing material, Molded-Oil[™], and are suitable for corrosive and contaminated environments at atmospheric pressure.

Food grade lubricants are also available.

Applications: Semiconductor cleaning equipment, FPD cleaning equipment, hard-disk cleaning equipment, food processing machinery, various conveyor lines

Operating Instructions and Notes

- For use in normal atmospheric conditions only.
- Because the solid lubricant used in these bearings will melt at a temperature of 120 °C, take care not to exceed temperatures of 100 °C when heating this bearing during the shrink-fit process for mounting.
- A radial load is required for the bearings to properly rotate. The minimum radial load to maintain proper rotation is at least 1 % of the basic dynamic load rating.
- Keep bearings packed until immediately before mounting.
- The scope of application (applied load, limiting $d_m n$ value) is listed in the table to the right.
- Avoid exposure to organic solvents with a degreasing effect.
- Bearings may not be usable in certain corrosive environments or conditions.
- All comments referencing certain values or performance in this catalog are for reference only. NSK provides this guide "as is" without express or implied warranties of any kind.

- Molded-Oil[™] provides continuous supply of lubrication oil
- No grease or oil refilling keeps operating environments clean
- Operating life more than twice that of grease lubrication in water or dust-contaminated environments
- Contact-seal bearings available in standard inventory (see Page A16)
- NSF H1 food-grade lubricants for food processing machinery also available.

6. Corrosion-Resistant Coated Bearings

Corrosion-resistant coated bearings are coated with a nickel coating on the outer and inner rings to enhance corrosion resistance and durability, and are suitable for corrosive environments at atmospheric pressure.

Page A17

Applications: Semiconductor/FPD/HD cleaning equipment, etching equipment, food processing machinery, various conveyor lines

Operating Instructions and Notes

A37 NSK

- Keep bearings packed until immediately before mounting.
- See the tables on Page A17 for limiting loads and limiting rotational speeds.
- A special clearance is adopted for the radial internal clearance. See the tables of SPACEA™ bearing nomenclature on Page A17.
- Dimensional tolerances of the bore and the outside diameter for corrosion-resistant coated bearings may deviate from the JIS Class 0 standard for coating thickness by a maximum of 5 µm in diameter.
- Bearings may not be usable in certain corrosive environments or conditions.

Operating Instructions and Notes

- Keep bearings packed until immediately before mounting.
- See the tables on Page A18 for limiting loads and limiting rotational speeds.
- C3 is the standard radial internal clearance.
- When bearings with aligning housing rings are used under radial loads, ensure that the radial load position is not on the notches (in two spots).
- The fit between the aligning housing ring and housing should be loose with a sufficient amount of clearance to ensure smooth, self-aligning performance.
- Please contact NSK if a bearing with an aligning housing ring will be mounted to a vertical shaft.
- Bearings may not be usable in certain corrosive environments or conditions.

8. All-Ceramic Bearings

Page A19

With ceramic outer/inner rings and balls, all-ceramic bearings have self-lubricating fluororesin cages and are suitable for corrosive environments and non-magnetic requirements at atmospheric pressure.

Applications: Corrosive environments: Semiconductor production machinery, chemical processing equipment, metal plating equipment Non-magnetic requirements: Electron beam drawing devices, electron beam exposure equipment, inspection equipment

Operating Instructions and Notes

- Keep bearings packed until immediately before mounting.
- See the tables on Page A19 for limiting loads and limiting rotational speeds.
- Due to the fragility of ceramic materials, please observe the following precautions:
- \bigstar Do not drop or strike the bearing.

A41 NSK

- A Allow for sufficient clearance when installing the bearing.
- \star Do not strike the bearing with a hammer or other tool when installing the bearing to a shaft or axlebox.
- A special clearance is adopted for the radial internal clearance. See the tables of SPACEA[™] bearing nomenclature on Page A19.
- Bearings may not be usable in certain corrosive environments or conditions.
- All comments referencing certain values or performance in this catalog are for reference only. NSK provides this guide "as is" without express or implied warranties of any kind.

9. Aqua-Bearing[™]

Page A20

Aqua-Bearing[™] features a special fluororesin for outer/inner rings and cage equipped to meet a broad range of applications in water, alkali and strong acid environments. Aqua-Bearing[™] is suitable for corrosive environments at normal pressures.

Applications: Semiconductor cleaning equipment, FPD cleaning equipment, hard-disk cleaning equipment, metal plating equipment, etching equipment, food processing machinery

Operating Instructions and Notes

A43 NSK

- For use in normal atmospheric conditions only.
- Keep bearings packed until immediately before mounting.
- See the tables on Page A20 for limiting loads and limiting rotational speeds.
- The Aqua-Bearing[™] adopts special standards for dimensional accuracy of the inner ring bore diameter, outside diameter of the outer ring, and radial internal clearance. See the tables on Page A20.
- Note that the bearing fit is large due to the linear expansion coefficient of the special fluororesin material $(\alpha = 1.7 \times 10^{-4}/^{\circ}C).$
- These bearings may not be usable with certain liquid medicines or under certain concentrations.
- All comments referencing certain values or performance in this catalog are for reference only. NSK provides this guide "as is" without express or implied warranties of any kind.

Features

- High corrosion resistance equivalent to that of ceramic bearings

12. E-DFO Bearings, V-DFO Bearings

New concept V-DFO and E-DFO bearings have special lubrication coatings applied to the rings, balls, and cage that deliver superior cleanliness and long life. The V-DFO specification uses low-vapor-pressure fluorinated lubricant while the E-DFO specification uses low-vapor-pressure hydrocarbon lubricant.

These bearings are suitable for cleanroom environments ranging from atmospheric pressure to vacuum conditions.

Applications: Manufacturing equipment for semiconductors, OLEDs, flat-panel displays, and hard disks; solar cell manufacturing; robots for vacuum environments

Operating Instructions and Notes

- Keep bearings packed until immediately before mounting.
- Avoid storing the bearing for a long amount of time.
- Wear clean gloves when handling.
- Mount the bearing without washing.

A49 NSK

- Avoid exposure to any oil or moisture.
- See the tables on Page A23 for limiting loads and limiting rotational speeds.
- Cleanliness is indicated per ISO 14644-1 (values in parentheses refer to former US FED-STD-209E Classes). Cleanliness may vary depending on operating conditions, surrounding components, and other factors.
- All comments referencing certain values or performance in this catalog are for reference only. NSK provides this guide "as is" without express or implied warranties of any kind.

Features

- Operating life more than four times longer than conventional fluorine-coated bearings
- Lower particle emissions and outgassing than MoS₂ solid lubricated bearings
- Usable in environments where lubricants containing metallic elements such as MoS₂ are not suitable
- Usable from atmospheric pressure to vacuums at 10⁻⁷ Pa (room temperature), although the degree of vacuum in which the bearings can be used varies according to operating temperature

Performance

Operating Instructions and Notes

- KPM grease is for normal atmospheric conditions only.
- Not applicable for cleanroom environments.
- Keep bearings packed until immediately before mounting.
- See the tables on Page A24 for limiting loads and limiting rotational speeds.
- Ensure an optimum radial internal clearance for maximum rotational performance by applying a fit to the bearing that

conisders bearing load, operating temperatures, materials of the shaft and/or housing (due to coefficient of linear expansion), etc.

All comments referencing certain values or performance in this catalog are for reference only. NSK provides this guide "as is" without express or implied warranties of any kind.

Features

- Usable in high-temperature environments up to 230 °C
- Longer operating life than commercially available fluorine greases (five times longer at 200 °C)
- Longer operating life than solid lubricant high-temperature bearings

Durability

KPM's operating life is approximately five times longer than commercially available fluorine greases.

KPM: NSK-developed grease for use at atmospheric pressure only

Oil separation and grease residual rates

KPM is highly heat resistant, with lower oil separation rates at higher temperatures than commercially available fluorine greases.

14. YS Bearings With Spacer Joints Page A25

YS bearings with spacer joints are made of an alloy-based self-lubricating material (sintered alloy) between balls. They are suitable for high-temperature and vacuum environments.

Applications: Ion implantation equipment, sputtering equipment, vacuum vapor deposition equipment

Operating Instructions and Notes

- For use in vacuum environments.
- Restrictions apply to bearings mounted to a vertical shaft due to a notch in the outer and inner rings. (Refer to the bearing manual)
- Keep bearings packed until immediately before mounting.
- Avoid storing the bearing for a long amount of time.
- Avoid exposure to any oil or moisture.
- The scope of application (limiting load, temperature) is listed in the table to the right.
- See the tables on Page A25 for limiting loads and limiting rotational speeds.
- Ensure an optimum radial internal clearance for maximum rotational performance by applying a fit to the bearing that considers bearing load, operating temperatures, materials of the shaft and/or housing (due to coefficient of linear expansion), etc.
- All comments referencing certain values or performance in this catalog are for reference only. NSK provides this guide "as is" without express or implied warranties of any kind.

Features

- Grease-free, MoS₂ solid lubrication
- Usable in vacuum up to 10⁻⁸ Pa and temperatures up to 350 °C
- Operating life is 10 times longer than conventional high-temperature solid-lubricant bearings

Bearing applications

Durability

Over ten times more durable than conventional high-temperature solid-lubricant bearings.

15. SJ Bearings Page A26

SJ bearings have a "peapod" structure, with solid lubricant spacer joints mounted between two balls in cage pockets. These bearings are suitable for high-temperature environments at atmospheric pressure up to vacuum.

Applications: Vacuum vapor deposition equipment, kilns, kiln cars, steel plants, high-temperature conveyance equipment

Operating Instructions and Notes

- Do not use this bearing in an environment with excessive moisture or humidity.
- Keep bearings packed until immediately before mounting.
- Avoid storing the bearing for a long amount of time.
- Avoid exposure to any oil or moisture before use.
- The scope of application (limiting load, temperature) is listed in the table to the right.
- See the tables on Page A26 for limiting loads and limiting rotational speeds.
- Ensure an optimum radial internal clearance for maximum rotational performance by applying a fit to the bearing that considers bearing load, operating temperatures, materials of the shaft and/or housing (due to coefficient of linear expansion), etc.
- All comments referencing certain values or performance in this catalog are for reference only. NSK provides this guide "as is" without express or implied warranties of any kind.

Features

- Grease-free, MoS₂ solid lubricant
- Applicable from atmospheric pressure up to vacuums at 10⁻⁸ Pa and temperatures up to 400 °C
- "Peapod" structure provides excellent torque stability and long life
- Over six times more durable than conventional high-temperature bearings with solid lubricant paste

torque stability.

Outgassing in vacuum conditions

No outgassing from chemical decomposition of the solid lubricant in spacer joints was seen in a hightemperature, vacuum environment.

Thus, pollution is not a concern with SJ bearings.

17. Molded-Oil[™] Bearings (For Contaminated Environments)

Molded-Oil[™] bearings feature a special material that provides a continuous supply of lubricating oil, allowing them to stand up to dust-contaminated environments at atmospheric pressure.

Applications: Food processing equipment, agricultural machines, woodworking machines, various conveyor lines

Operating Instructions and Notes

- For use in normal atmospheric conditions only.
- Because the solid lubricant used in these bearings will melt at a temperature of 120 °C, take care not to exceed temperatures of 100 °C when heating this bearing during the shrink-fit process for mounting.
- A radial load is required for the bearings to properly rotate. The minimum radial load to maintain proper rotation is at least 1 % of the basic dynamic load rating.
- Keep bearings packed until immediately before mounting.
- See the "4. Molded-Oil[™] Bearings (Stainless Steel)" on Pages A33 and A34 for applications requiring corrosion resistance.
- The scope of application (applied load, limiting $d_m n$ value) is listed in the table to the right.
- Avoid exposure to organic solvents with a degreasing effect.
- Bearings may not be usable in certain corrosive environments or conditions.
- All comments referencing certain values or performance in this catalog are for reference only. NSK provides this guide "as is" without express or implied warranties of any kind.

Features

- Continuous controlled flow of oil from Molded-Oil[™] inside the bearing provides sufficient lubrication
- No grease or oil filling keeps operating environments clean
- Operating life in dust-contaminated environments is more than twice that with grease
- Comes standard with a contact seal (See table below).

(1) Cleanliness is indicated per ISO 14644-1 (values in parentheses refer to former US FED-STD-209E Classes).

Cleanliness may vary depending on the usage conditions and surrounding structure.

 $(2)d \cdot n =$ Shaft diameter of ball screws (mm) × rotational speed (min⁻¹)

Surface treatment durability test results for

1. Corrosion-Resistant Ball Screws and NSK Linear Guides (Fluoride Low-Temperature Chrome Plating)

NSK Linear Guides and ball screws are used in industrial machinery, semiconductor production, flat panel display manufacturing equipment, and more. Preventing rust from developing in these applications is crucial, particularly for machines around water such as part/device washers and for semiconductor/FPD manufacturing equipment involved in chemical wet processing.

NSK applies a fluororesin coating to an electrolytic black plating (flouride low-temperature chrome plating) on these linear guides and ball screws for optimal rust resistance.

Electrolytic rust-resistant black plating + fluororesin coating

- Black plating: treated to form a stable thin film (1-2 µm), which is a form of black chrome galvanization
- A fluororesin coating is applied to this film to enhance corrosion resistance
- Low-Temperature treatment with no hydrogen brittleness Outstanding durability on rolling surfaces, compared with enables stable, accurate control
- Thin-film and high corrosion-resistance properties reduce factors that might adversely affect the accuracy of parts

Note: Avoid using organic solvents, which may degrade the treatment's rust prevention properties.

LG2 and LGU "clean" greases are utilized for low-dust specifications of NSK products such as linear guides, ball screws, Monocarriers, Megatorque Motors, XY modules and XY tables. These greases are excellent for cleanrooms thanks to their lower particle emissions and better resistance to corrosion than fluorine greases. Their proven track record makes them particularly suitable for semiconductor production equipment.

Extremely low particle emissions

LG2/LGU greases offer stable low-dust characteristics over a longer period than fluorine greases.

Stable low-torque characteristics

LG2/LGU greases significantly reduce the burden on motors running at high speeds by achieving torque less than 20% that of fluorine greases (ball screws, at 500 min⁻¹).

Superior rust prevention

LG2/LGU greases provide high reliability by preventing rust.

3. NSK Lubricant E-DFO

In a world first, E-DFO lubricant forms a hydrocarbon oil film directly on the raceway surfaces of ball screws, linear guides, and rolling elements. In vacuum environments, this results in lower outgassing than with other lubricants like fluorine grease and lower particle emissions and longer life than with existing fluororesin coatings or solid lubricants.

Features

Better retains lubrication through low-vapor-pressure oil and adsorbent thin-lubricant film technology.

- Low particle emissions and superior outgassing compared to conventional fluororesin-coated and solid lubricant products
- Far more durable than fluororesin-coated products

Structural illustration

Low-vapor-pressure hydrocarbon oil coating that

Flake-shaped PTFE powder increases the surface area for adhered lubricant, increasing lubricant retention.

Notes:

The E-DFO coating is a clear, low-vapor-pressure hydrocarbon-based, semi-dry coating that is viscous on the surface.

- 1. Handling: Open the package immediately before use in a clean space with the lowest possible humidity (less than 60%). Handle with cleanroom gloves; do not touch the product with bare hands.
- 2. Storage: If the sealed product is not used for a long period or is not used immediately after opening, store in a clean, dry container such as a desiccator or vacuum chamber to prevent rust and deterioration. Do not use slushing oil or anti-tarnish paper on the product.
- 3. Do not clean: E-DFO coated products do not require cleaning. Do not clean or wipe the coating on the rolling surface-this will directly affect the lubricating function.
- 4. Do not apply new lubricant: E-DFO coated ball screws and linear guides do not require additional lubricant. Do not use with the NSK K1 lubrication unit, as this will degrade E-DFO's lubricating properties.
- 5. Installation position: When using ball screws and linear guides vertically, use an oil receiver under the screw shafts and rails as the E-DFO coating may drip.

6. NSK K1[™]/NSK K1-L[™] Lubrication Unit

(1) Ball screws equipped with NSK K1[™] and linear guides equipped with NSK K1[™]/NSK K1-L[™] for general industry

NSK has developed specialized lubrication units for ball screws and linear guides. Ball screws with NSK K1 and linear guides with NSK K1/NSK K1-L offer maintenance-free performance over a long period. (See pages B27-28 for details on NSK K1 in linear guides for food processing and medical equipment.)

Features of Ball Screws with NSK K1

Notes at bottom page also apply to ball screws with NSK K1.

Features of Linear Guides with NSK K1

With a porous resin structure full of oil, NSK K1 units are installed on the inner side of end seals where they greatly enhance lubricating capabilities.

NSK K1-L for improved performance

- NSK K1-L improves on the original NSK K1 with a higher capacity supply of lubricating oil, enabling even longer maintenance-free operation.
- NSK K1-L is applied to NH, VH, NS, DH, DV, DS, and HS models.

Notes:

- To maintain optimal performance of NSK K1/NSK K1-L note the following:
- 1. Operating temperatures: Maximum operating temperature: 50°C Maximum momentary operating temperature: 80°C
- 2. Avoid contact with: Organic solvents with degreasing properties, such as hexane and immersion in white kerosene thinner or anti-corrosive oil (containing white kerosene)

Performance

Durability test without lubricant

A linear guide without lubricant was damaged after a short period, but the K1-equipped linear guide covered a distance exceeding 50 000 km.

Conditions

Water-immersion test

In a water-immersion test run once a week for 24 hour intervals, the ball groove of a linear guide fitted with standard double seals guickly showed wear and damage at 2 700 km. By comparison, the linear guide equipped with NSK K1 showed only 1/3 as much wear, confirming significant lubricating efficacy.

Conditions

Linear guide: LS30 stainless steel (preload Z1) Water immersion: Run once a week for 24 hours, fully immersed in water Lubrication: Fully grease-packed for food processing machinery Speed: 24 m/mir

Dust generation

The combination of NSK K1 and LG2/LGU "clean" greases (low-particle-emission grease) produced no more dust than conventional grease for vacuum environments.

Conditions Linear guide: LS20 Speed: 36 m/min

Notes: Compatibility of NSK K1 with oils and chemicals

The table on the right shows test results after immersing NSK K1 in chemicals and oils at 40° C. NSK K1 was found to be stable when in contact with grease and cutting lubricants, and use in combination with these substances presents no problems. However, exposure to chemicals with degreasing properties, such as white kerosene and hexane, quickly removed oil content from the surface of the seals, suggesting that the lubricating effect may deteriorate under these conditions.

6. "NSK K1[™]" Lubrication Unit

(2) Linear guides equipped with NSK K1[™] for food processing and medical equipment

NSK K1 for food processing machinery/medical equipment is safe and FDA-compliant. With a porous resin structure full of lubricating oil, NSK K1 units are installed inside a end seal where they greatly enhance

lubricating capabilities. After success in general industry, we utilized special materials to allow use in food processing and medical equipment.

Features

Safe to handle

Long life

Note: Linear guides with high-performance seals come standard with the NSK K1-L lubrication unit. The seals will jut out

Improved resistance to contaminants achieves durability twice that of standard seals in an environment with fine wood particles and over five times

> Dimensions of a linear guide equipped with high-performance seals and NSK K1-L

Covers the top surface of the rail and prevents foreign matter from entering the rail mounting bolt holes.

Note: Linear guides with V1 seals come standard with the NSK K1 lubrication unit. This makes the slide length slightly longer with standard seals. See the table on Page B32 for details.

Since sealing (resistance to foreign matter) is affected by usage and the lubrication environment, please conduct an evaluation test for your particular application.

8. Ball Screws and NSK Linear Guides for **High-Temperature Environments**

NSK has developed heat-resistant ball screws and linear guides in response to high-temperate operating environments. Our products serve a variety of high-temperature applications, such as semiconductor and flat panel display production, glassware manufacturing, and automobile assembly lines.

Features Linear Guides for High-Temperatures

Maximum operating temperature: 150 °C; maximum momentary temperature: approximately 200 °C (Standard

models: 80 °C; maximum momentary temperature: approximately 100 °C) • All-stainless-steel specification: All-stainless-steel products are excellent at resisting not only heat, but also corrosion and chemicals.

These can also be used in vacuum environments.

Structure

Special high-carbon steel with excellent rolling durability or martensite stainless steel with high cleanliness are used for the rails, ball slide, and balls. A heat- and chemical-resistant fluororubber is used for the seal, while corrosion-resistant austenite stainless steel is used for the remaining components.
